

ENGINEER'S DAY 2024

IEI ALIGARH LOCAL CENTRE

15 September 2024

AI and Sustainable Development

Firaas Ahmed Khan

B. Tech Artificial Intelligence

(3rd year student)

AMU Aligarh

firaaskhan@gmail.com

*An engineer,
administrator and
statesman*

*Tribute to Bharatratna
Sir M. Visvesvaraya
(1861 - 1962), who was
born on September 15.*

Sir Mokshagundam Visvesvaraya with Maharaja Mysore

Artificial intelligence

Machine learning

Deep learning

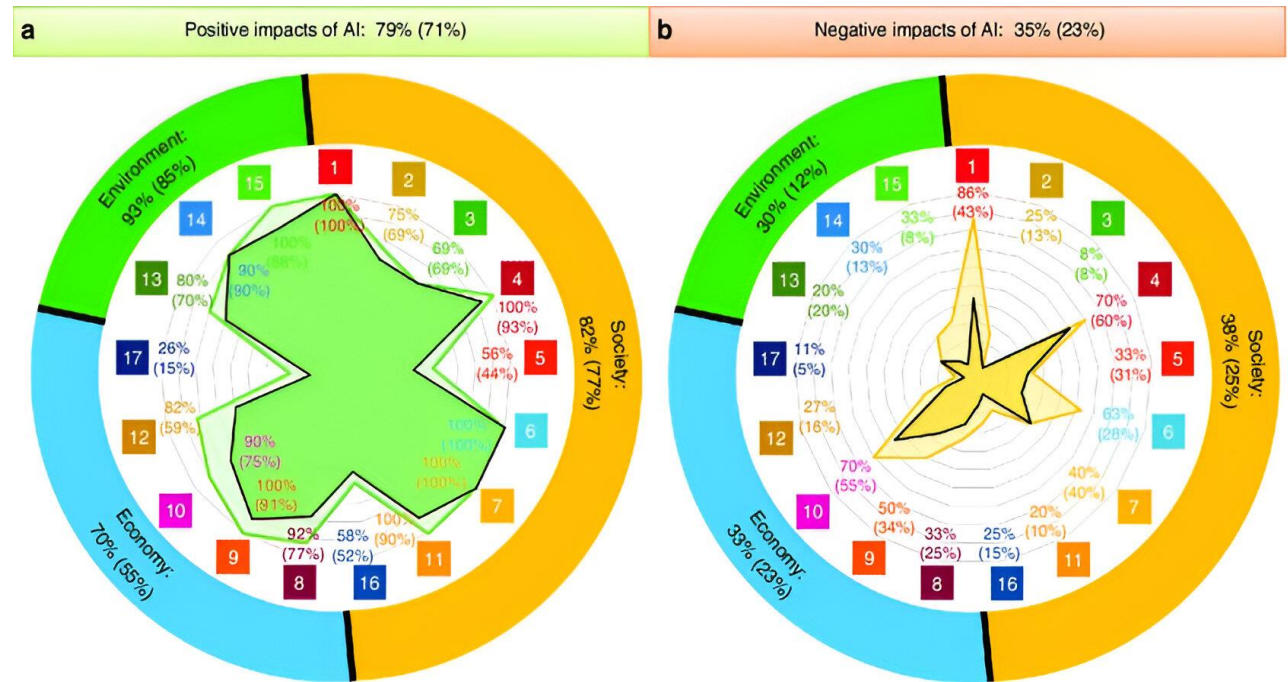

SUSTAINABLE DEVELOPMENT GOALS

Impact on Society

- AI has the potential to support **societal improvements** by contributing to **134 SDG targets**, such as reducing poverty, improving education, and providing clean water.
- AI technologies can help **optimize smart cities**, efficiently manage resources, reduce carbon footprints, and promote renewable energy use.
- However, AI could negatively affect **59 SDG targets**, particularly by increasing **inequalities** and causing **job displacement** for those lacking digital skills.
- The **high cost and resources** needed for advanced AI can widen the gap between **developed and developing nations**, exacerbating global inequality.

Economic Implication

- AI has the potential to accelerate the achievement of **134 targets** across all **17 SDGs**, such as eradicating poverty, improving education, and providing clean water.
- AI-driven technologies can optimize **smart cities**, manage resources efficiently, reduce carbon footprints, and promote renewable energy integration.
- On the downside, AI could negatively impact **59 SDG targets**, particularly by widening **economic inequalities** and causing **job losses** for workers lacking digital skills.
- Advanced AI may increase the gap between **developed and developing nations** due to the high cost and resource requirements of the technology.

Environmental Impact of AI

- **AI** can play a crucial role in **climate action** and **resource management** by monitoring and predicting environmental changes such as deforestation and desertification.
- AI-powered **satellite imagery analysis** can help identify areas at risk of environmental degradation, enabling **proactive ecosystem preservation** efforts.
- However, the **energy consumption** of AI technologies, particularly in **data centers**, can contribute to increased **carbon emissions**.
- To avoid compromising environmental goals, it's essential to focus on making **AI systems more energy-efficient** as they continue to grow.

AI can improve health care and make quality care more accessible

Collecting patient history

Automated diagnosis

Treatment recommendations

Staff/resource allocation

Surgical robots

Therapy development

Virtual health assistants

AI can monitor wildlife

AI can facilitate disaster prediction,
assessment and response planning

AI **for** sustainability

Sustainability **of** AI ?

Thank You
